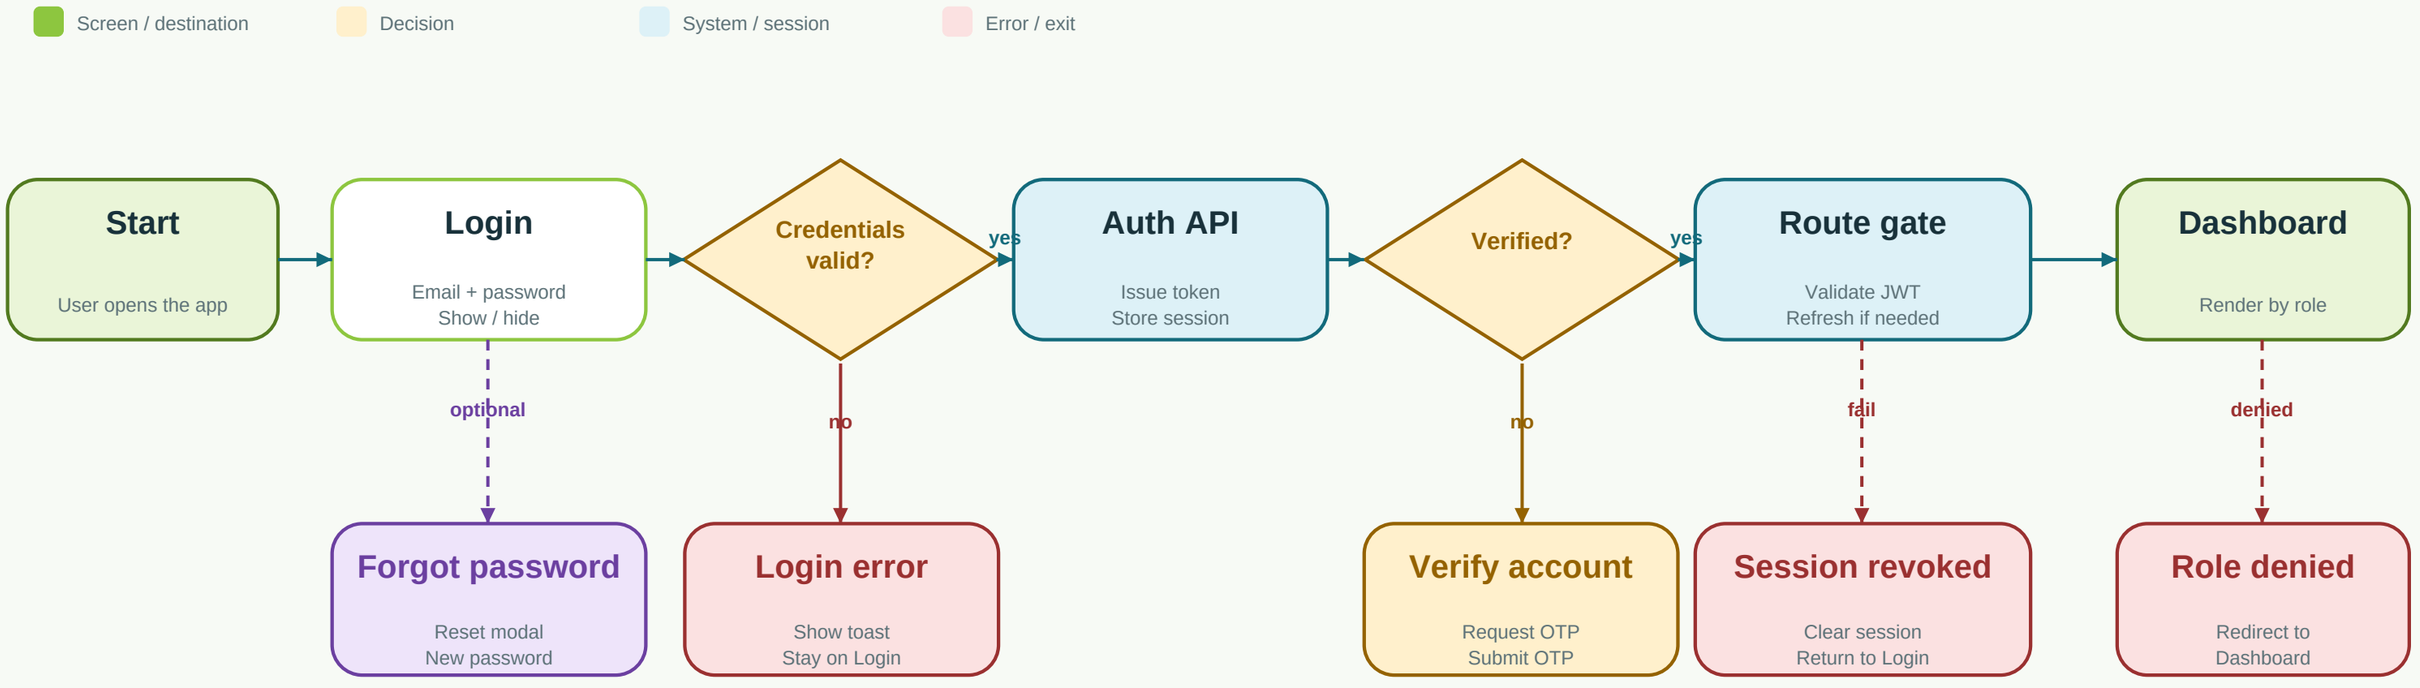
Project Anu - End-to-end user flow

Authentication, session protection, role resolution, and entry into the workspace



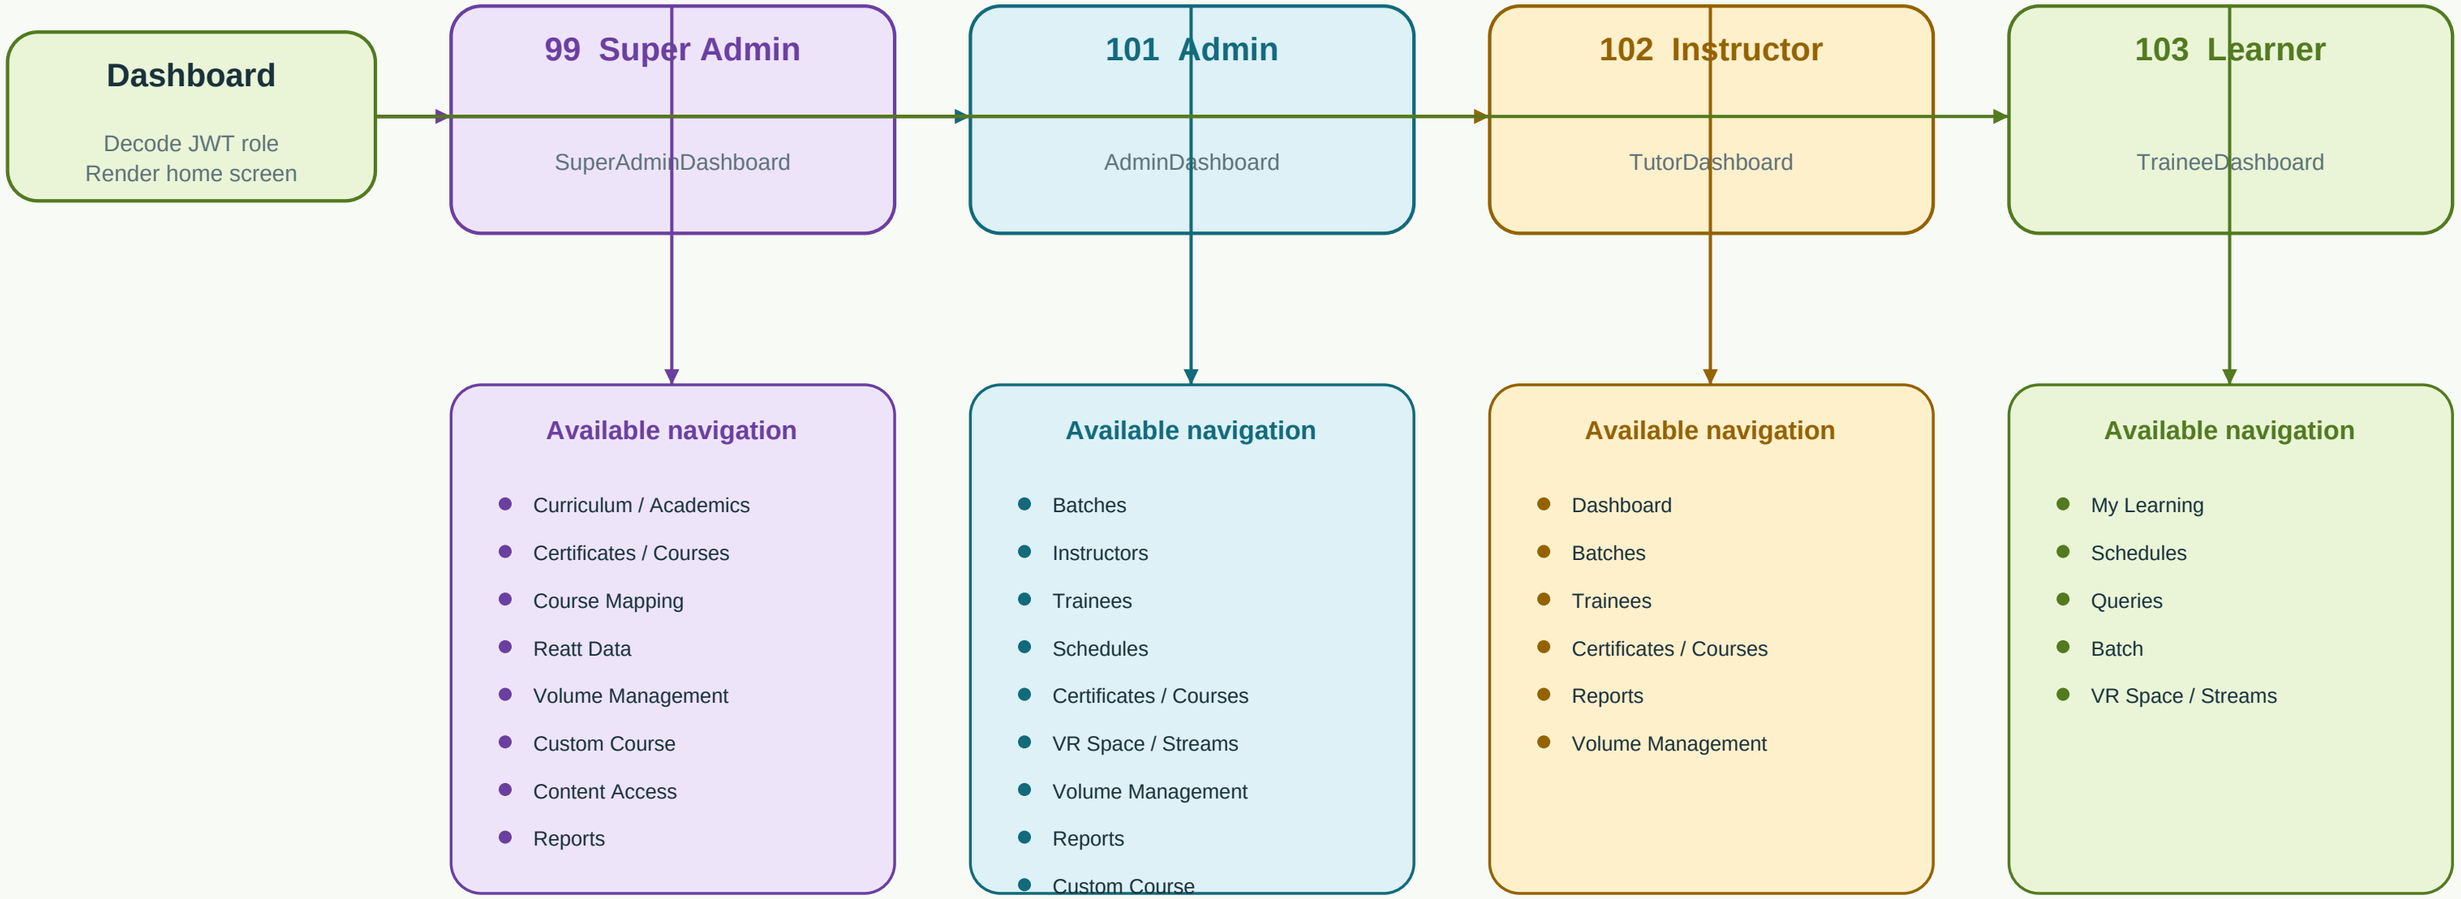
Guardrails implemented in the code

- PrivateRoute checks localStorage user_token before rendering protected pages.
- JWT sid and expiry are validated; expired tokens attempt refresh-token before logout.
- A session heartbeat validates the active session every 10 seconds and on window focus.
- Socket session:revoked events force local-session cleanup and return the user to Login.

Role-based workspace navigation

The dashboard component and sidebar expose different destinations for each role

Screen / destination Decision System / session Error / exit



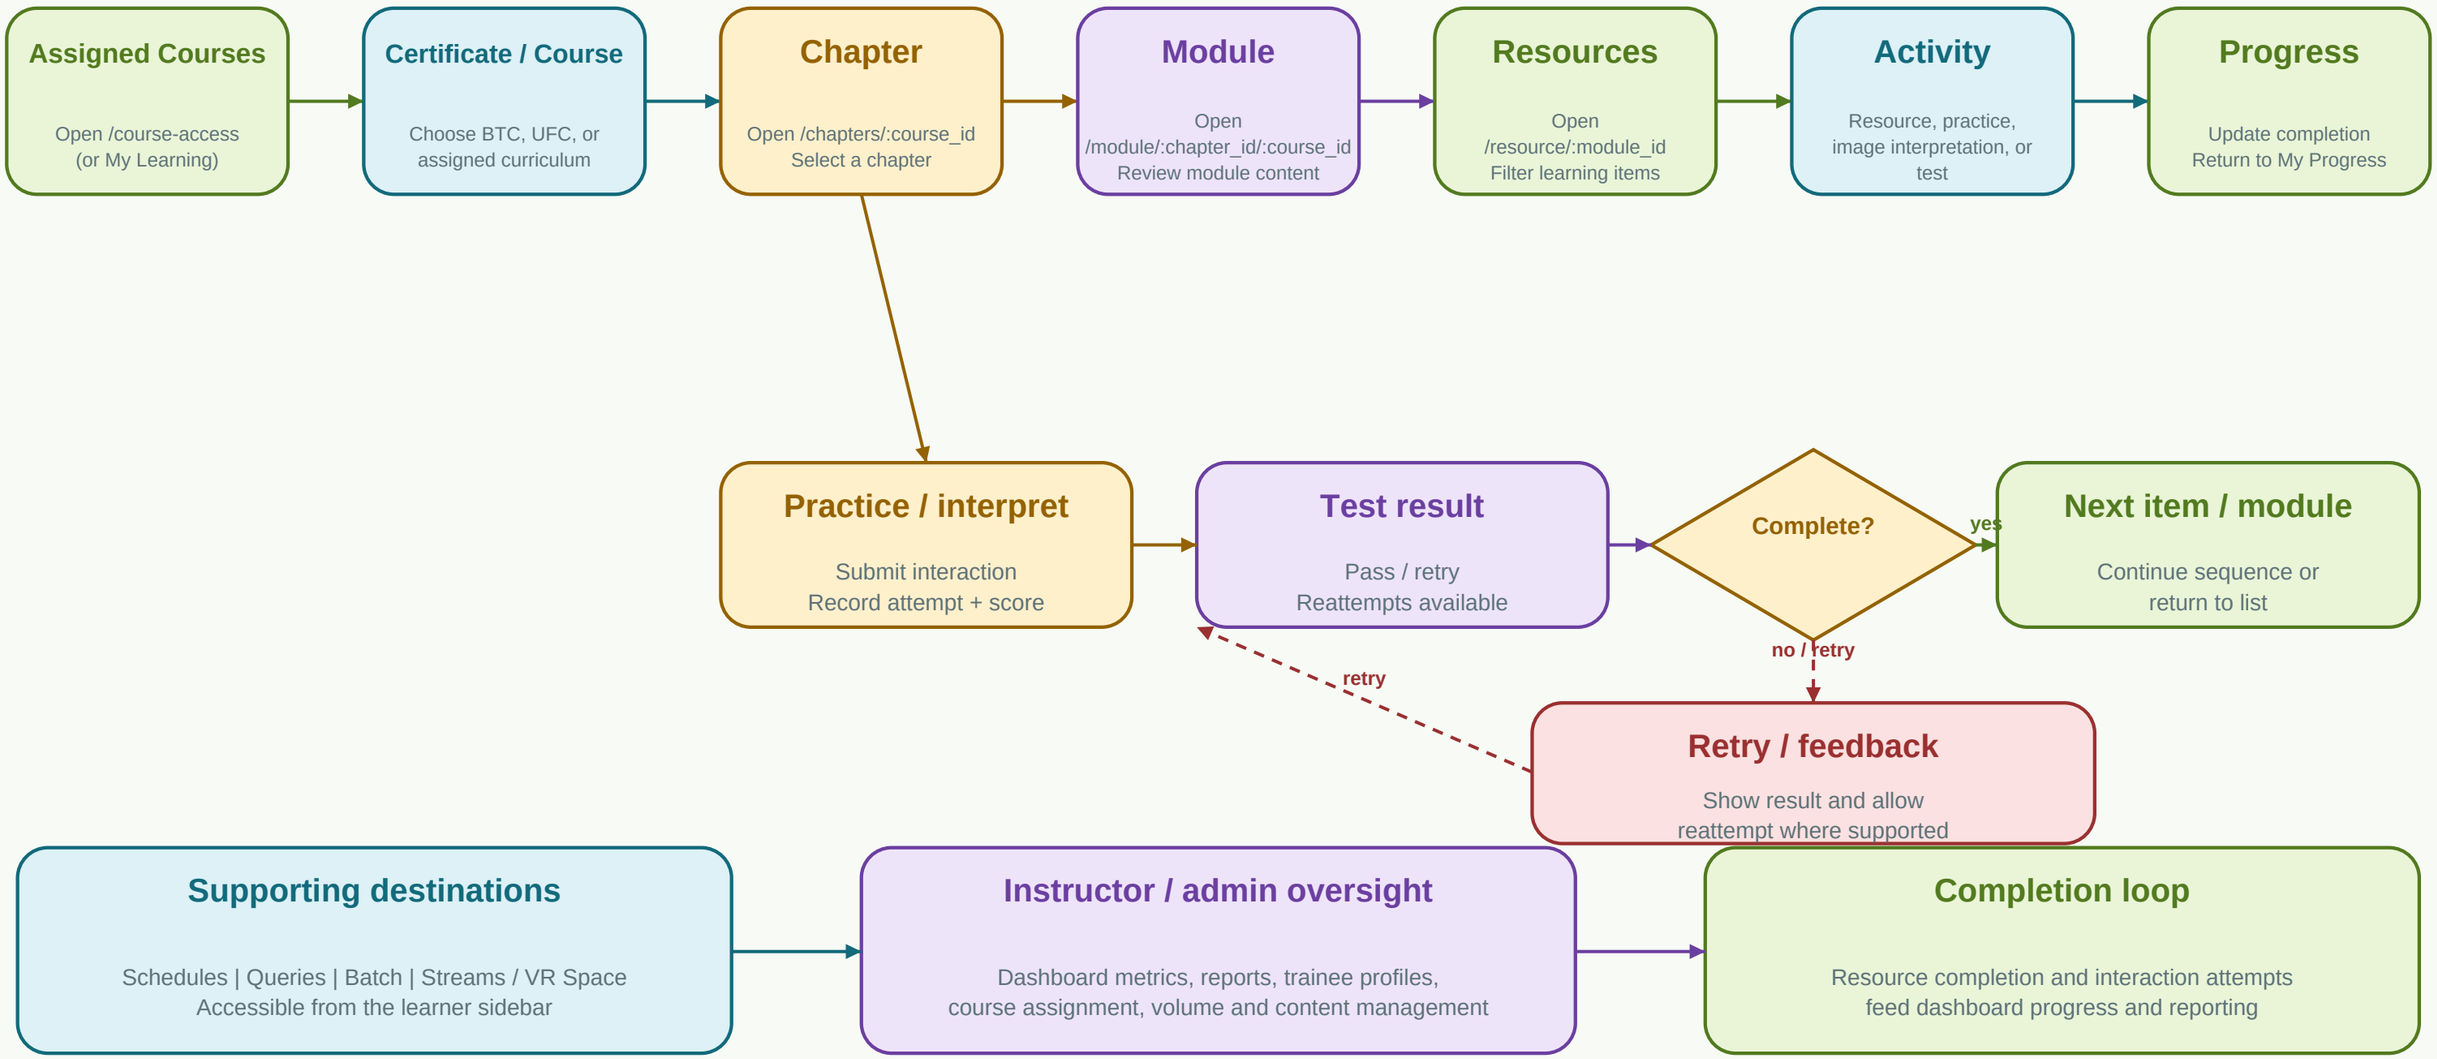
Common shell actions: sidebar navigation, notifications, profile modal, schedules/sessions, and logout.

Access control is enforced both by explicit allowedRoles wrappers and by route-prefix role rules in ProtectedRoutes.

Learner learning journey

Primary learner path from assigned course to module activities, progress, and completion

Screen / destination | Decision | System / session | Error / exit



Implemented routes referenced by this journey: /course-access, /my-learning, /cert-course/:certificate_id, /chapters/:course_id, /module/:chapter_id/:course_id, /resource/:module_id, /my-progress.
